

One name, two stores.

Clerk greets you by it. The backend keeps the copy every later feature reads. Edit one, and they quietly disagree.

Two Places at Once.

@SRIVARDHANJALAN

THE BUG I SHIPPED

One Save has to reach **both**.

UPDATE

Save your name

One Save fans out to two stores. Write only the first and the record the rest of the app reads goes stale the instant you rename yourself.

`user.update()`

Clerk

your identity · greets you on Home

`updateProfile()`

Backend record

DynamoDB · what later steps read

The original app wrote only Clerk, so the backend copy went stale. The accent write is the one line that keeps both honest.

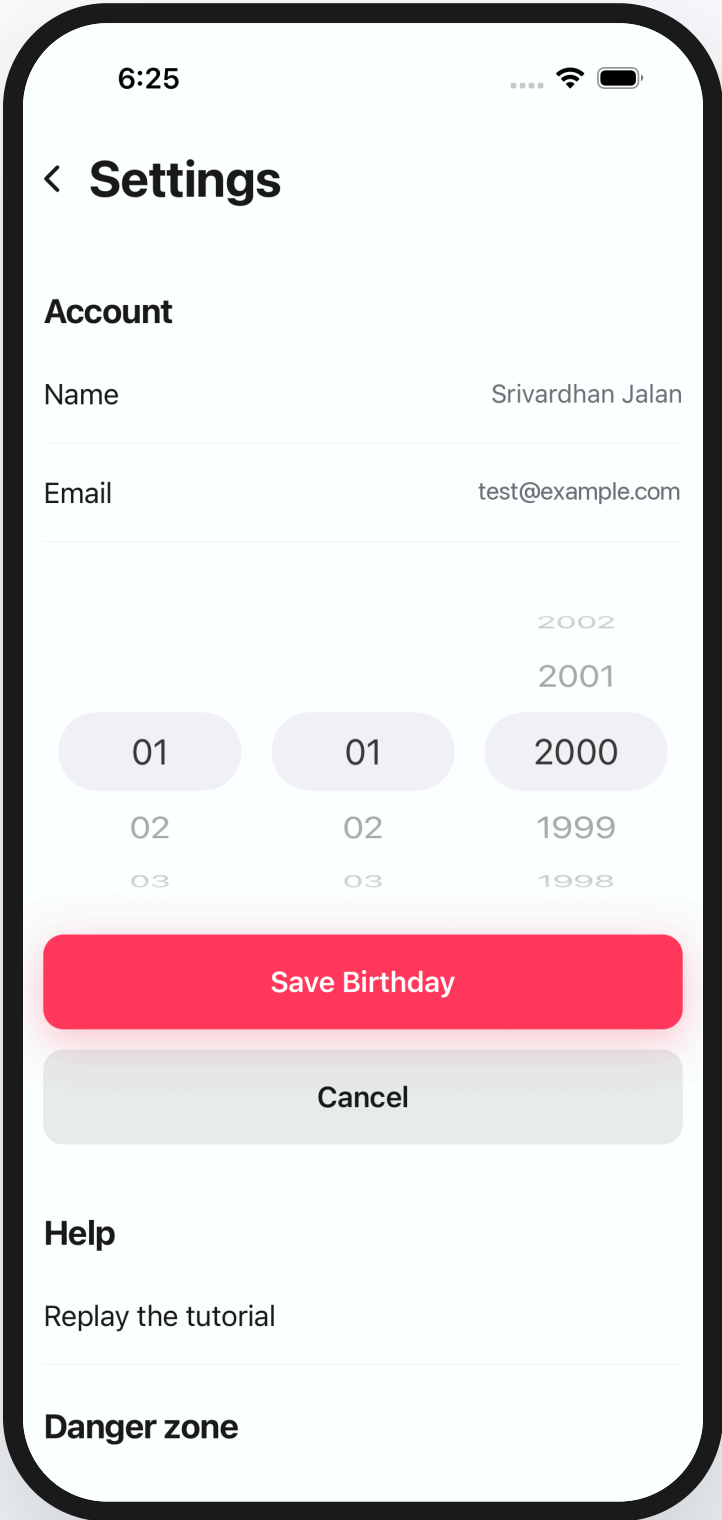

THE RULE I TOOK FROM IT

A fact kept in two places, edited in one, is a bug with a delay on it.

PADDING IS DATA

The wheels came up blank.

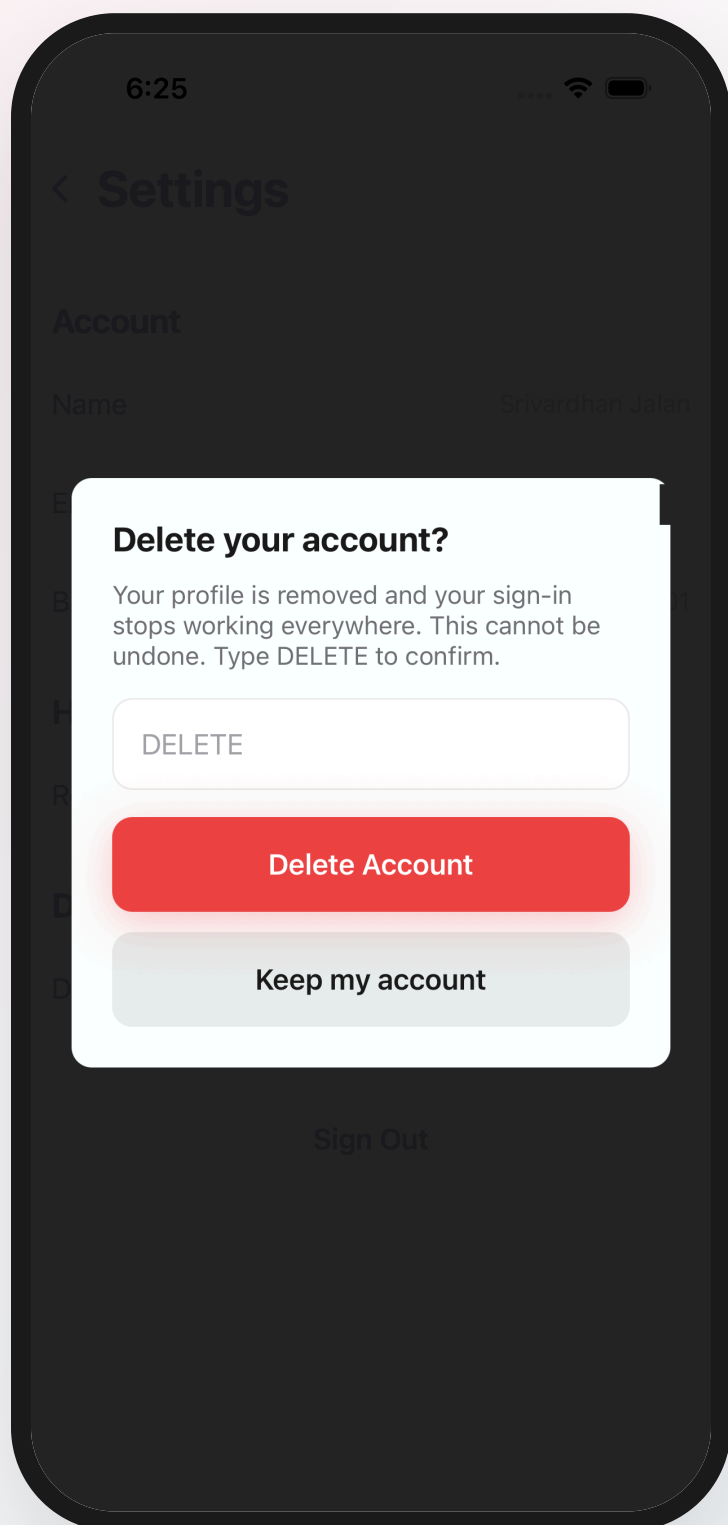

Three empty columns on
a birthday that was
clearly saved, all from
one padding mismatch.
Fixed, they land on the
date.

DELETING YOU FOR GOOD

Delete the irreversible thing **first.**

Two writes tear you down:
revoke Clerk, flag the
record. Order them so
whichever one fails, the
state left behind is the
harmless one.

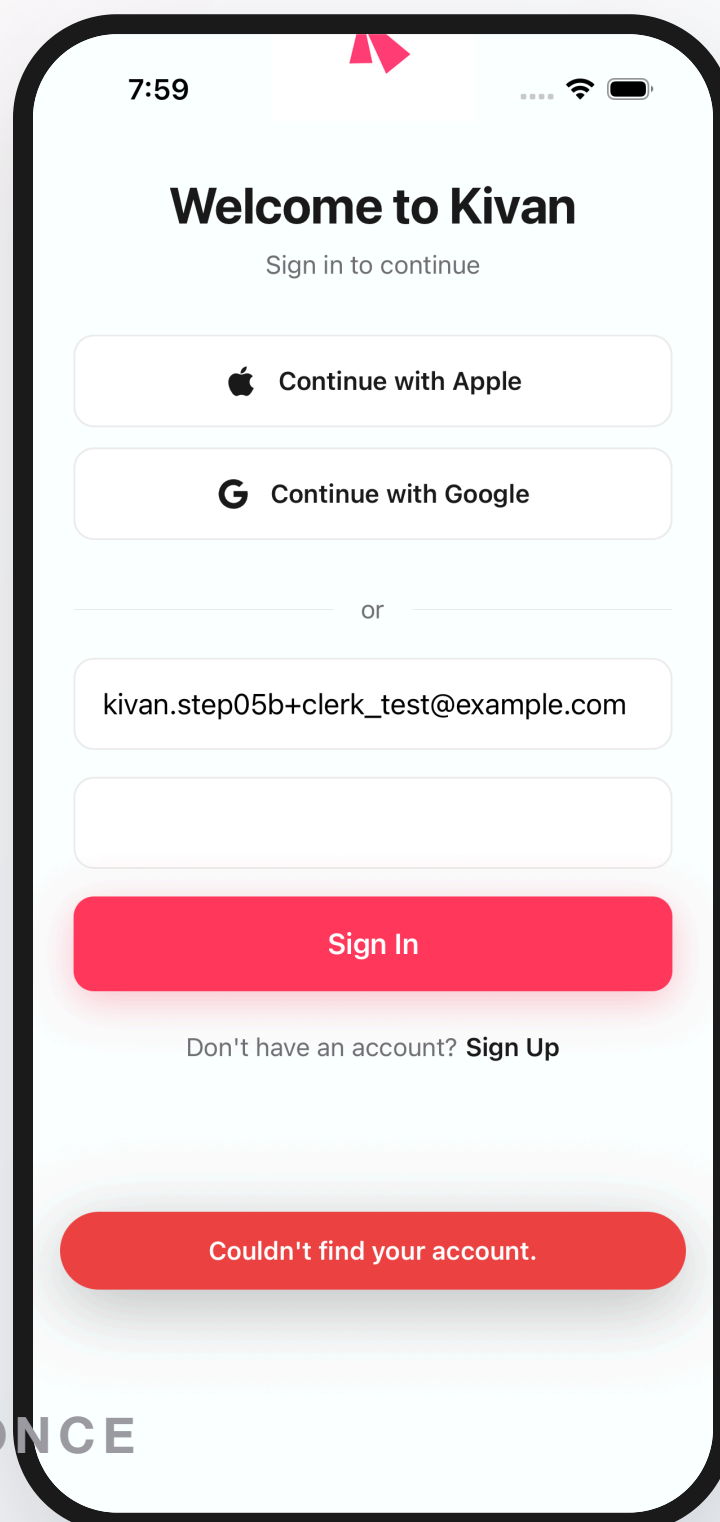

TWO PLACES AT ONCE

5 / 7

THE PAYOFF

"Couldn't find your account."

I typed DELETE into my own app, signed back in with the right password, and it didn't know me.

ZERO TO SHIPPED · STEP 05

**The full write-up is
free on Medium.**
