

Photos that can't leak.

Fully private storage,
so there is no public
link to leak, and every
photo still loads on
cue.

SWIPE →

Photos Without the Exposure.

@SRIVARDHANJALAN

THE PART THAT SURPRISED ME

The photo never touches my backend.

ADD

Upload a photo

The bytes go straight to S3, never through the backend. It hands out a link and claims the photo on Save.

NOTHING IS PERMANENT YET

Permanent only on Save.

Every upload waits in a holding area, and if you never Save, it clears itself a day later.

PRIVATE, BUT IT STILL RENDERS

A sealed bucket that still **loads**.

READ

View a photo

The bucket is private. The backend signs a short-lived link; you load the photo straight from S3 before it expires.

WHAT BIT ME

A Save that deleted the photo it was keeping.

The client sent back a link that never matched the stored one, so Save deleted the file it meant to keep. The fix: compare by the file's key, not the raw string.

NOTHING LEFT BEHIND

Nothing is ever left orphaned.

DELETE

Delete your account

Photos have no delete button. The backend sweeps them when you delete the account.

You

delete my account

Backend
App Runner

delete both objects

S3
private

An upload you never save needs no backend: **S3 deletes the pending/ object after 1 day.**
